Sarel Roller & Brush

How to survive droughts and downpours

In any summer, the turf tends to become sealed by a combination of dust and foot traffic. This results in the irrigation or rainfall lying on the surface and then evaporating off without being absorbed into the root zone. And when it does rain, a sealed surface hinders it from draining away, leaving you with a mass of puddles.

> Hence the benefit of using a Sarel Roller to spike the surface

followed immediately by a brush to sweep the dew down the holes into the root zone. And when it rains, you will have an open surface that drains freely.

SAREL ROLLER

Working width	1.5m (5')
Weight	135kg
REAR DEW BRUSH	
Working width	1.5m (5')
Weight	8kg

THE SOLUTION....

- Thousands of small holes pricked through sealed turf surfaces
- Decreased use of wetting agents
- Brushing disperses moisture, reducing fusarium risk

Ideal for use before and after overseeding, to increase germination rate
